AC cost of string inverters

Overview

String inverters are the most common type used in residential solar systems. They are typically less expensive than other options, with costs ranging from \$1,000 to \$3,000, depending on the system size and brand. The simplicity of string inverters makes them an attractive choice for many homeowners. Will string inverters cost more than central inverter?

CAPEX Material Market experts expect string inverters to be priced 0.5 cents/watt higher than central inverters in North America utility-scale systems.

How much does a solar inverter cost?

Inverter costs usually range from \$1,000 to \$3,000 or so, depending on your solar energy system's total power capacity. What is a solar inverter?

A solar inverter is a piece of electrical equipment that converts (or "inverts") newly generated direct current (DC) electricity into alternating current (AC) electricity.

What is a string inverter?

String inverters are the simplest and lowest cost option. When using a string inverter, the solar panels are wired together in a series and connected by a single string to a large inverter installed on your home next to your utility meter.

How much does a microinverter cost?

While they cost more than string inverters, averaging \$1.15 per watt, they offer the benefit of independent panel optimization. For a 5 kW system, the cost is approximately \$5,750. Microinverters generally come with warranties of around 25 years, which aligns with the expected lifespan of the solar panels themselves.

Are microinverters better than string inverters?

While microinverters are generally seen as a more efficient technology than string inverters, they are also more expensive to install and can be a headache to replace if they fail. If you're assembling your own small solar energy system, you may find it easier to purchase your inverter as part of a solar generator or portable power station.

How big is a string inverter?

A typical string inverter is around 50 pounds and around 30 inches tall, 20 inches wide, and 8 inches deep — roughly the size of an acoustic guitar (without the neck or the guy at the bonfire playing it). These types of inverters are best for solar systems that receive full sun and have panels mounted in one large grouping.
