

SolarMax Energy Systems

Analysis of wind power profitability of communication base stations

Overview

Wind power is one of the fastest-growing technologies for renewable energy generation. Unfortunately, in the recent years some cases of degradation on certain telecommunication systems have arisen.

Which telecommunication services are more sensitive to wind turbines?

The telecommunication services included in this review are those that have demonstrated to be more sensitive to nearby wind turbines: weather, air traffic control and marine radars, radio navigation systems, terrestrial television and fixed radio links.

Can wind energy be used to power mobile phone base stations?

Worldwide thousands of base stations provide relaying mobile phone signals. Every off-grid base station has a diesel generator up to 4 kW to provide electricity for the electronic equipment involved. The presentation will give attention to the requirements on using windenergy as an energy source for powering mobile phone base stations.

Why is wind power a problem in telecommunications?

Wind power is one of the fastest-growing technologies for renewable energy generation. Unfortunately, in the recent years some cases of degradation on certain telecommunication systems have arisen due to the presence of wind farms, and expensive and technically complex corrective measurements have been needed.

How does a wind farm affect TV services?

Interference effects of a wind farm on TV services In the case a wind farm degrades the analog television quality, secondary or ghost images are observed, which are dependent on the amplitude and the relative delay between the transmitted signal and the scattered signals.

Are radiolinks obstructed by wind turbines?

It is clearly observed that the radiolinks depicted in green are not obstructed

by the wind turbines, while the turbines intercept the second Fresnel zone of the radiolink depicted in red. Fig. 13. Example of the exclusion volumes that should be respected to avoid diffraction effects on radiolinks .

How can a wind turbine not disturb a radio link?

The proper location for the turbine to not disturb the radio link can be assessed by applying the bistatic radar equation in suitably small increments of the distance of the wind turbine to the radio path until the required value of C/I ratio is obtained .

5.3. Mitigation measures

Analysis of wind power profitability of communication base stations

Exploiting Wind Turbine-Mounted Base Stations to Enhance ...

We investigate the use of wind turbine-mounted base stations (WTBSs) as a cost-effective solution for regions with high wind energy potential, since it could replace or even outperform ...
