Base station distribution box construction

Overview

What is a distributed base station architecture?

In a distributed base station architecture, the traditional macro station equipment have two distinct units based on their functions: the BBU and the RRU. The BBU centralizes the “baseband,” “transmission,” “main control,” “clock,” and other functions of the base station.

What materials are used in the construction of distribution boxes?

Here are some common materials used in the construction of distribution boxes: 1. Metals Distribution Boxes Metals are widely used in distribution box construction due to their durability, strength, and suitability for various environments. Common metals include:.

What are the different types of base stations?

Some basic types of base stations are as follows: Macro-base stations are tall towers ranging from 50 to 200 feet in height, placed at strategic locations to provide maximum coverage in a given area. Those are equipped with large towers and antennas that transmit and receive radio signals from wireless devices.

What is a residential distribution box?

Residential distribution boxes are designed for use in homes and smaller residential buildings. They are typically compact, user-friendly, and cater to the electrical demands of typical household applications. Main Distribution Board (MDB): Central hub for distributing electrical power throughout the home.

What is a base station?

What is Base Station?

A base station represents an access point for a wireless device to

communicate within its coverage area. It usually connects the device to other networks or devices through a dedicated high bandwidth wire or fiber optic connection. Base stations typically have a transceiver, capable of sending and receiving wireless signals;.

What are the components of a base station?

Power Supply: The power source provides the electrical energy to base station elements. It often features auxiliary power supply mechanisms that guarantee operation in case of lost or interrupted electricity, during blackouts. **Baseband Processor:** The baseband processor is responsible for the processing of the digital signals.
