Overview

What is the potential of wind power in Bhutan?

Wind Energy Bhutan has substantial capacity for leveraging wind power systems. The restricted theoretical development potential for wind power in the country is estimated to be approximately 761 MW, with Wangdue Phodrang exhibiting the highest potential at 141.7 MW, followed by Chhukha at 91.8 MW (DRE, 2015).

What is Bhutan's energy supply?

Bhutan's energy supply primarily relies on electricity, fuel-wood, coal, and diesel. Electricity is the largest contributor, with a shift towards increased usage over the years. Fuel-wood usage has decreased, while bio-gas, solar energy, and limited-scale wind energy have gained traction as alternative sources.

Which power plants are used in Bhutan?

In addition to hydropower, the country relies on diesel generators owned by Bhutan Power Corporation (BPC), contributing 8.93 MW to the overall capacity. Furthermore, the grid is connected to solar photovoltaic (PV) power plants with a capacity of 724 kWp and wind power plants with a capacity of 600 kW.

What is the thermal energy consumption in Bhutan?

Thermal energy consumption in the Industry is dominated by coal, which is a vital input for many industries in Bhutan. However, liquid fuels such as diesel, kerosene oil, and furnace oil account for less than 6 percent of the industry's thermal energy mix.

Does Bhutan have a hydropower sector?

Bhutan's Hydropower Sector plays a crucial role in generating electricity, capitalizing on its abundant hydropower resources. The country has a considerable hydropower potential, estimated at 37,000 MW, of which 33,000

MW is techno-economically viable.

What is Bhutan's oldest mega power plant?

Chhukha Hydropower Plant: As Bhutan's oldest mega power plant, the Chhukha Hydropower Plant was commissioned in 1986. It has a capacity of 336 MW, with four hydro-turbine units each generating 84 MW. The plant's annual electricity generation exceeds 1,800 GWh, and a significant portion is exported to India.
