

## SolarMax Energy Systems

# Can lead-carbon energy storage batteries be frequency-controlled

## Overview

---

Are battery energy storage systems suitable for PFC (primary frequency control)?

1.1. Motivations The recent successful operation of a 100 MW Battery Energy Storage System (BESS) installed in South Australia indicates that BESSs are very well suited for PFC (Primary Frequency Control) due to their fast response

Can lead batteries be used for energy storage?

Advanced lead batteries are used for energy storage in various projects, including utility and renewable energy storage. The Consortium for Battery Innovation has developed an interactive map showcasing their global use. These batteries deliver reliable, sustainable, safe, and affordable energy storage, as seen in examples from national grid stabilizing to microgrids.

How does the PFC of a battery work?

Therefore, the PFC of the battery usually works on average 50% in under-frequency and 50% over-frequency periods with a zero mean energy. However, using a FD frequency control characteristic, due to the internal losses of the battery the SoC is expected to gradually decrease to 0.

What is the PFC of a battery?

Frequency fluctuations distribute symmetrically around  $f_{nom}$  and follow a normal distribution or a binomial one if a deadband in governors controller of CG is present. Therefore, the PFC of the battery usually works on average 50% in under-frequency and 50% over-frequency periods with a zero mean energy.
