

## SolarMax Energy Systems

# Capacity of base station lead-acid batteries

## Overview

---

What are the characteristics of lead-acid battery?

The lead-acid battery performance is comparatively stable but reduces with the passage of time. Temperature correction factor: The battery cells capacity is generally provided for a standardized temperature which is 25°C and if it varies somewhere with the installation temperature, a correction factor is needed to implement.

How long does a lead-acid battery last?

This is the primary factor that limits battery lifetime. Deep-cycle lead-acid batteries appropriate for energy storage applications are designed to withstand repeated discharges to 20 % and have cycle lifetimes of ~2000, which corresponds to about five years. Battery capacity is reported in amp-hours (Ah) at a given discharge rate.

What is a duty cycle for a lead acid battery?

The standard recommends a duty cycle be drawn showing the anticipated loads (in [ [Ampere]] or power) for the required duration of battery backup time. IEEE 485 Std. Recommended Practice for Sizing Lead Acid Batteries for Stationary Applications - Typical Duty Cycle Considerations.

Is a lead acid battery a good choice?

The lead acid battery maintains a strong foothold as being rugged and reliable at a cost that is lower than most other chemistries. The global market of lead acid is still growing but other systems are making inroads. Lead acid works best for standby applications that require few deep-discharge cycles and the starter battery fits this duty well.

How does a lead-acid battery cell work?

A lead-acid battery cell consists of a positive electrode made of lead dioxide (PbO<sub>2</sub>) and a negative electrode made of porous metallic lead (Pb), both of

which are immersed in a sulfuric acid ( $H_2SO_4$ ) water solution. This solution forms an electrolyte with free ( $H^+$  and  $SO_4^{2-}$ ) ions. Chemical reactions take place at the electrodes:.

What is the voltage of a lead-acid cell?

The voltage of a typical single lead-acid cell is  $\sim 2$  V. As the battery discharges, lead sulfate ( $PbSO_4$ ) is deposited on each electrode, reducing the area available for the reactions. Near the fully discharged state (see Figure 3), cell voltage drops, and internal resistance increases.
