Communication Mobile Micro Base Station Solution

Overview

What is a micro base station?

A micro base station is mostly used in cities with a small coverage distance, generally 1-2 km, and directional coverage. A micro-micro base station is mostly used for blind spot coverage in urban hotspots. Generally, the transmission power is very small and the coverage distance is 500m or less.

What is a mobile communication base station?

Mobile communication base station is a form of radio station, which refers to a radio transceiver station that transmits information between mobile phone terminals through a mobile communication exchange center in a certain radio coverage area.

What is the difference between a macro base station and a micro base station?

A macro base station has a large coverage distance, generally 35 km, and is suitable for suburban areas with dispersed traffic. It has omnidirectional coverage and high power. A micro base station is mostly used in cities with a small coverage distance, generally 1-2 km, and directional coverage.

Why is construction of mobile communication base stations important?

The construction of mobile communication base stations is an important part of the investment of mobile communication operators, and is generally carried out around factors such as coverage, call quality, investment benefits, construction difficulty, and maintenance convenience.

Can MBS and Mibs co-exist in a mobile communication network?

In future mobile communication networks, the coexistence and overlapped coverage of macro BS (MBS) and micro BS (MiBS) make their cooperation feasible. With the development of ISAC empowering mobile communication system, MBS and MiBS cooperative sensing is expected to achieve large-

coverage and high-accuracy sensing .

Is multi-BS cooperative sensing a promising solution for 6g mobile communication system?

Abstract—Addressing the communication and sensing demands of sixth-generation (6G) mobile communication system, integrated sensing and communication (ISAC) has garnered traction in academia and industry. With the sensing limitation of single base station (BS), multi-BS cooperative sensing is regarded as a promising solution.
