Components of flow batteries

Overview

A flow battery, or redox flow battery (after), is a type of where is provided by two chemical components in liquids that are pumped through the system on separate sides of a membrane. inside the cell (accompanied by current flow through an external circuit) occurs across the membrane while the liquids circulate in their respective spaces.

Anode: Site of oxidation (loss of electrons). Cathode: Site of reduction (gain of electrons). Membrane: Separates the two electrolytes while allowing ion exchange to maintain charge balance. Pumps and Pipes: These components circulate the electrolyte between the tanks and the cell.

Components of flow batteries

Flow Batteries: Definition, Pros + Cons, Market Analysis & Outlook

Flow batteries typically include three major components: the cell stack (CS), electrolyte storage (ES) and auxiliary parts. A flow battery's cell stack (CS) consists of ...
