Cost calculation of UHV energy storage and transmission in power plants

Overview

How are energy transmission costs normalized?

Additionally, since the transmission methods have different energy carrying capacities, costs were normalized by the amount of delivered energy, where energy capacities for chemical fuels are based on the lower heating value (LHV). Results are reported for capital cost (in both \$/mile and \$/mile-MW), and transportation cost (\$/MWh).

Does long-distance transmission cost more than renewable electricity?

For electricity, the cost of long-distance transmission (which still does not include storage and distribution costs) significantly exceeds the cost of renewable electricity production and would constitute the major share of the overall electricity cost.

What is the full cost of electricity?

THE FULL COST OF ELECTRICITY is an interdisciplinary initiative of the Energy Institute of the University of Texas to identify and quantify the full-system cost of electric power generation and delivery – from the power plant to the wall socket. The purpose is to inform public policy discourse with comprehensive, rigorous and impartial analysis.

How much does a MWh of electricity cost?

The average \$/MWh for generation power in the 41-100% range corresponds to \$1.71/MWh, while the average for compression was found to be \$0.39/MWh. For every 1 MWh generated, only 0.56 MWh of electricity is needed for compression on average (Farley, 2020b) so the charging maintenance O&M is \$0.22/MWh generated.

How can energy conversion technologies be used for production and consumption?

Multiple pathways and energy conversion technologies may be utilized for

production and consumption of various energy carriers. For example, on the production side, renewable electricity can be used to generate hydrogen through water electrolysis.

Are electricity and hydrogen transport costs more expensive than oil and natural gas?

In a recent work F. Saadi et al. (2018) compared the relative costs of transporting energy by electricity and chemical fuels using a common set of assumptions and concluded that “the cost of electricity and hydrogen transmission are substantially higher than the cost of oil and natural gas transportation”.

Cost calculation of UHV energy storage and transmission in power p

Cost of long-distance energy transmission by different carriers

This paper compares the relative cost of long-distance, large-scale energy transmission by electricity, gaseous, and liquid carriers (e-fuels).
