

SolarMax Energy Systems

Danish container refrigerated power generation

Overview

Why is Denmark launching a green container ship facility?

This initiative represents a significant step forward in reducing emissions and enhancing sustainable port operations in Northern Europe. The facility, designed specifically for container ships, will mark the first of its kind in Denmark and solidify the Port of Aarhus's commitment to green transformation.

Does Denmark have a power grid?

Several direct current cables connect the two Danish systems to neighboring countries. The western Danish power grid is connected to Norway with 1,700 MW (Skagerrak) and Sweden with 740 MW (Konti-Skan). The 700 MW (COBRACable) connects Jutland and the Netherlands, and the 1,400 MW Viking Link is planned to connect Jutland and England.

What voltage does a reefer container need?

Reefer containers typically operate on a standard voltage of 380-460V and require three-phase electrical plugs to function efficiently. This setup ensures a stable and consistent power supply, which is critical for maintaining the precise temperature control needed for sensitive cargo.

Do reefer containers rely on electricity?

Reefer containers rely on electricity as their primary power source. The power supply options vary depending on the stage of the container's journey: While onboard cargo ships, reefer containers are typically plugged into the vessel's electrical grid.

Do reefer containers use generators?

For transportation by road or rail, reefer containers often use a diesel-powered generator set (gen-set). These gen-sets are mounted on the container or the transport vehicle, providing a reliable power source throughout the journey.

What is a containership power supply (Ops)?

Containerships rely on the highly pollutant marine fuel to operate, contributing to 50-60% of all ship emissions. Onshore power supply (OPS) is the delivery of shore side electrical power to a ship at berth so its main and auxiliary engines can be turned off.
