

## SolarMax Energy Systems

# Different types of wind power generation systems

## Overview

---

To equip a wind turbine with any three-phase generator, such as a synchronous generator and asynchronous generator, ensure more consistent operations. In this article, we will mainly talk about different types of wind turbine generators and their functions.

A DC wind generator system has a wind turbine, a DC generator, an insulated gate bipolar transistor (IGBT) inverter, a transformer, a controller, and a power grid. For shunt-wound.

AC synchronous wind turbine generators can take constant or DC excitations from either permanent magnets or electromagnets. This is why they both are called “permanent magnet.

When the traditional way of power generation uses synchronous generators, modern wind power systems use induction machines, extensively in wind turbine applications. The induction generators are classified into two types: fixed-speed induction generators (FSIGs) with squirrel cage rotors, and doubly-fed induction generators.

Switched reluctance wind turbine generators have features such as strong rotor and stator. With the rotor's rotations, the reluctance of the magnetic circuit linking the stator and rotor changes. It then, in turn, induces currents in the winding on the armature (stator). The reluctance rotor is built from laminated steel sheets, and it does not hav.
