

## SolarMax Energy Systems

# Do bifacial solar panels work

## Overview

---

Do bifacial solar panels work?

If you're considering ground-mounted solar, bifacial panels might perform better by capturing light reflected from the ground. Similarly, they work well on free-standing structures like pergolas, where there's no obstruction behind the panels, allowing them to capture sunlight from both sides.

How do bifacial solar panels generate electricity?

Bifacial solar panels generate electricity by capturing sunlight on both the front and rear sides. A portion of sunlight is directly absorbed by the solar cells, while some light gets trapped within the panel glass and eventually absorbed.

What is the difference between monofacial and bifacial solar panels?

Monofacial solar panels use an opaque backsheet that only permits the front face of the panel to receive sunlight. Conversely, Bifacial solar features light-absorbing panels exposed on both sides. This enables them to absorb reflected light from surfaces such as white rooftops, sand, or snow.

Are bifacial panels more energy efficient?

With more surface area available to absorb sunlight, bifacial panels are generally more efficient than traditional monofacial panels. For example, a study by solar panel manufacturer LONGi found that bifacial panels produced 11% more energy than standard panels as part of a ground-mounted installation.

Do bifacial panels need direct sunlight?

**Myth Debunked:** Many assume bifacial panels require direct rear sunlight, but they actually rely on diffuse light. Even on cloudy days, they outperform monofacial panels because scattered light reflects more evenly onto both surfaces.

## Are bifacial solar panels a smart upgrade?

Bifacial solar panels are a smart upgrade for anyone looking to get more energy from the same space. Since they can capture sunlight from both sides, they often produce more electricity than regular panels. They're also built to last longer and look sleeker.
