

## SolarMax Energy Systems

# Eastern European rooftop photovoltaic energy storage

## Overview

---

Can rooftop solar power systems help Europe's energy transition?

Rooftop systems could cover up to 24.4% of the EU electricity consumption (based on 2016 levels). Rooftop solar photovoltaic (PV) systems can make a significant contribution to Europe's energy transition. Realising this potential raises challenges at policy and electricity system planning level.

What is the rooftop solar PV comparison update?

The Rooftop Solar PV Comparison Update produced by CAN Europe and eco-union, with contributions from our members, is an updated version of the Rooftop Solar PV Comparison Report published by CAN Europe in May 2022.

How much solar energy will EU rooftops produce a year?

The results show that the EU rooftops could potentially produce 680 TWh of solar electricity annually (representing 24.4% of current electricity consumption), two thirds of which at a cost lower than the current residential tariffs.

Are EU member states facilitating rooftop solar deployment?

The report examines EU Member States (Bulgaria, France, Germany, Greece, Italy, Latvia, Lithuania, Portugal, Romania, Spain and Sweden) on their good and bad practices when it comes to facilitating rooftop solar deployment in the EU.

What is the economic potential of rooftop PV?

The economic potential of rooftop PV could potentially cover 16.8% of the total electricity consumption in the EU. Grid infrastructure and operation costs may render part of the economic potential less attractive investment.

Can rooftop energy systems contribute to the EU energy transition?

France, Spain and Germany could also cover a significant part (20–30%) of their annual consumption with such systems. Considering the very large energy needs of these three countries, it appears that rooftop systems can play a major role in the EU energy transition, even if they are only partially utilised.
