Economic calculation of energy storage peak-shaving power stations

Overview

Based on the relationship between power and capacity in the process of peak shaving and valley filling, a dynamic economic benefit evaluation model of peak shaving assisted by hundred megawatt-scale electrochemical ESS considering the equivalent life of the battery is proposed. What is peak shaving demand analysis?

Peak shaving demand analysis primarily provides the total peak shaving power requirement, total peak shaving energy requirement and Continuous charging and discharging time for the energy storage cluster.

Does es capacity enhance peak shaving and frequency regulation capacity?

However, the demand for ES capacity to enhance the peak shaving and frequency regulation capability of power systems with high penetration of RE has not been clarified at present. In this context, this study provides an approach to analyzing the ES demand capacity for peak shaving and frequency regulation.

What is peak shaving & frequency regulation?

The strategy addresses the temporal demands of peak shaving and frequency regulation in the power grid. It quantifies the minimum capacity, power, rate and duration time requirements for energy storage stations to actively support the grid, helping the dispatch center make informed decisions and identify suitable stations for each demand scenario.

Why do energy storage clusters deftly discharge energy during peak load periods?

During peak load periods, energy storage clusters deftly discharge stored energy to alleviate grid strain, concurrently adjusting power output in response to frequency variations to uphold grid stability .

What are the different types of energy storage stations?

From a functional standpoint, the energy storage stations within the cluster can be categorized into three distinct types: frequency regulation energy storage stations, peak shaving energy storage stations, and hybrid energy storage stations capable of both peak shaving and frequency regulation functionalities.

What is the power and capacity of Es peaking demand?

Taking the 49.5% RE penetration system as an example, the power and capacity of the ES peaking demand at a 90% confidence level are 1358 MW and 4122 MWh, respectively, while the power and capacity of the ES frequency regulation demand are 478 MW and 47 MWh, respectively.

Economic calculation of energy storage peak-shaving power station

Proceedings of

Energy storage is a key component in the scheduling process of photovoltaic storage and charging stations, and the existing research stations mainly consider the benefits of peak ...
