

## SolarMax Energy Systems

# Energy Storage Device Bow

## Overview

---

Imagine a crossbow: you pull the string, store energy in the limbs, and release it to fire an arrow. Now replace the arrow with a power grid. Sounds wild?

Modern adaptations, like the vertical bow design patented in 2010 [1], use composite rollers and tension springs to boost efficiency. What is an energy bow?

An energy bow was a type of bow whose string and arrows were made of energy rather than a solid material. The bounty hunter Shalla Mondatha was known to wield one such weapon. Those built by the Nightsisters of Dathomir were plasma-based. The soldier Jannah used a variant of the energy bow.

How does a bow store energy?

When a bow is drawn, it stores energy. The farther it's drawn, the more energy is stored. When the bowstring is released, this stored (potential) energy is converted into kinetic energy of the projectile (among other things). The amount of energy stored in a bow can be calculated by plotting its force-draw or F/D curve.

Does a bow limb have energy storage?

A bow limb made out of steel will be considerably heavier than a similarly-sized limb made out of a superior material, and thus may have similar energy storage. In any case, if a material is capable of storing fairly small amount of energy per unit of mass, it only means that: It's best to focus on utilizing leverage as much as possible.

## Energy Storage Device Bow

---

### How to calculate the bow s energy storage

Determining how much energy a bow stores is fairly straightforward. The bow's Force/Draw (F/D) curve (draw weight per inch of draw length) must be accurately determined (more discussion ...
