Energy storage power station project lacks funds

Overview

Does project finance apply to energy storage projects?

The general principles of project finance that apply to the financing of solar and wind projects also apply to energy storage projects. Since the majority of solar projects currently under construction include a storage system, lenders in the project finance markets are willing to finance the construction and cashflows of an energy storage project.

Do we have post-generation energy storage issues?

We have post-generation storage issues as well. Usually, when people think about post-generation energy storage, they think of electrochemical batteries. However, batteries represent a small minority of electrical storage capacity at present. About 90% of current grid storage is in the form of pumped hydro facilities.

Why is energy storage oversupply a problem?

The expansion is driven mainly by local governments and lacks coordination with new energy stations and the power grid. In some regions, a considerable storage oversupply could lead to conflicts in power-dispatch strategies across timescales and jurisdictions, increasing the risk of system instability and large-scale blackouts.

What technology risks are associated with energy storage systems?

Technology Risks Lithium-ion batteries remain the most widespread technology used in energy storage systems, but energy storage systems also use hydrogen, compressed air, and other battery technologies. Project finance lenders view all of these newer technologies as having increased risk due to a lack of historical data.

Is excessive energy storage a threat to China's power system?

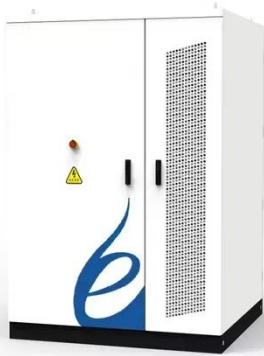

But the risks for power-system security of the converse problem — excessive

energy storage — have been mostly overlooked. China plans to install up to 180 million kilowatts of pumped-storage hydropower capacity by 2030. This is around 3.5 times the current capacity, and equivalent to 8 power plants the size of China's Three Gorges Dam.

Why do energy storage stations have different voltage levels?

The situation is further complicated by electrochemical-energy storage stations that operate at different voltage levels, hindering the suppression of fluctuations caused by inherently variable energy sources, such as wind and sunlight. Expansion of the capacity to generate energy must align with the capacity to store it.
