making optimal refrigeration effect;

Overview

A flow battery is a rechargeable fuel cell in which an electrolyte containing one or more dissolved electroactive elements flows through an electrochemical cell that reversibly converts chemical energy to electrical energy. Electroactive elements are "elements in solution that can take part in an electrode reaction.

A flow battery, or redox flow battery (after), is a type of where is provided by two chemical components in liquids that are pumped through the system.

Redox flow batteries, and to a lesser extent hybrid flow batteries, have the advantages of: • Independent scaling of energy (tanks) and power (stack).

The hybrid flow battery (HFB) uses one or more electroactive components deposited as a solid layer. The major disadvantage is that this reduces.

Other flow-type batteries include the , the , and the .MembranelessA membraneless battery relies on in.

The (Zn-Br₂) was the original flow battery. John Doyle file patent on September 29, 1879. Zn-Br₂ batteries have relatively high specific energy, and.

The cell uses redox-active species in fluid (liquid or gas) media. Redox flow batteries are rechargeable () cells. Because they employ rather than or they are more similar to .

Compared to inorganic redox flow batteries, such as vanadium and Zn-Br₂ batteries, organic redox flow batteries' advantage is the tunable redox properties of their active.

A flow battery is a rechargeable fuel cell in which an electrolyte containing one or more dissolved electroactive elements flows through an electrochemical cell that reversibly converts chemical energy to electrical energy.
