

## SolarMax Energy Systems

# General structure of flow battery

## Overview

---

Flow battery design can be further classified into full flow, semi-flow, and membraneless. The fundamental difference between conventional and flow batteries is that energy is stored in the electrode material in conventional batteries, while in flow batteries it is stored in the electrolyte.

A flow battery, or redox flow battery (after ), is a type of where is provided by two chemical components in liquids that are pumped through the system.

A flow battery is a rechargeable in which an containing one or more dissolved electroactive elements flows through an .

The cell uses redox-active species in fluid (liquid or gas) media. Redox flow batteries are rechargeable ( ) cells. Because they employ rather than or they are more similar to .

Compared to inorganic redox flow batteries, such as vanadium and Zn-Br<sub>2</sub> batteries, organic redox flow batteries' advantage is the tunable redox properties of their active.

The (Zn-Br<sub>2</sub>) was the original flow battery. John Doyle file patent on September 29, 1879. Zn-Br<sub>2</sub> batteries have relatively high specific energy, and.

Redox flow batteries, and to a lesser extent hybrid flow batteries, have the advantages of: • Independent scaling of energy (tanks) and power (stack).

The hybrid flow battery (HFB) uses one or more electroactive components deposited as a solid layer. The major disadvantage is that this reduces.
