

SolarMax Energy Systems

Germany s industrial electricity peak shaving and energy storage

Overview

Does peak shaving reduce electricity consumption?

Since peak shaving does not reduce consumption but only shifts loads total electricity consumption is increased due to charging/discharging losses of the EVs' batteries. Figure 1: development of the power price of the distribution system operators Bayernwerk, Netze BW, WW Netz and EWE Netz.

Does peak shaving increase power grid stability?

As opposed to this study, most previous studies related to peak shaving focus mainly on increasing electric grid stability [/KEPCO-01 17/, /UBR-02 19/], increase flexibility of power systems /HULU-01 19/ and benefits to power grid companies [/SUOE-01 19/, /UOCO-01 15/].

Can EVs be used for peak shaving?

Potentially millions of EVs in Germany alone could not only draw power from the grid but could be additionally used to discharge back to the grid and thus provide flexibility to the energy system. One possible application of this flexibility is using EVs for peak shaving for industrial sites, i.e. reducing maximum power consumption of.

Can electric vehicles reduce the cost of electricity in Germany?

The rising population of electric vehicles (EVs) and the high cost of grid fees mean that there is a huge potential for reducing electricity costs through peak shaving in Germany. To calculate potential revenues via bidirectional charging (Vehicle-to-Business) of EVs, the cost of electricity for industries is linearly minimized.

Will peak consumption reduce electricity costs for industrial consumers?

A reduction in peak consumption could significantly bring down total electricity costs of industrial consumers while simultaneously reducing the peak demands placed on the electricity grid. Grid fee makes up a significant

part of the electricity price for industrial consumers /BDEW-01 20/.

Does peak shaving increase EV battery EFC?

Due to peak shaving, the EV battery charges and discharges more than normal, which increases the EFC of an EV battery. However, the mean increase in EFC for bidirectional charging compared to smart charging is between 0.11 to 0.32 EFCs/a, whereas the maximum increase in EFC is 4.2 EFCs/a for 30 EVs. This increase in EFCs is extremely low.

Germany's industrial electricity peak shaving and energy storage

The HBD-A Series from MPMC is an all-in-one, liquid-cooled

1 day ago · The HBD-A Series from MPMC is an all-in-one, liquid-cooled battery energy storage system, covering 100kW-1000kW with capacities from 241.2kWh-2090kWh. Applications: ?Self-consumption optimization - maximize solar energy utilization ?Peak shaving & load shifting - reduce ...
