High-voltage lithium battery pack life

Overview

Environmental conditions, not cycling alone, govern the longevity of lithium-ion batteries. The worst situation is keeping a fully charged battery at elevated temperatures. Battery packs do not die suddenly, but the runtime gradually shortens as the capacity fades. Lower charge voltages prolong battery.

The lithium-ion battery works on ion movement between the positive and negative electrodes. In theory such a mechanism should work forever, but cycling, elevated.

Courtesy of Cadex Source: Choi et al. (2002) B. Xu, A. Oudalov, A. Ulbig, G. Andersson and D. Kirschen, "Modeling of Lithium-Ion Battery Degradation for Cell Life Assessment,".

Lithium-ion batteries usually last 2 to 4 years or 600 to 1,000 charge cycles before their performance drops. Store batteries in cool, dry places at about 30–50% charge to slow down aging and prevent damage. Avoid fully charging or fully discharging batteries during storage to extend their lifespan.

High-voltage lithium battery pack life

Application of HV lithium battery

HV lithium batteries can operate at voltages up to 4.4V or higher, which allows for a higher energy density and a longer runtime. One of the most common ...
