

## SolarMax Energy Systems

# How much energy does a storage project typically consume

## Overview

---

Which components of a data center contribute most to energy consumption?

We'll break down the components of a data center contributing most to overall energy consumption below: Servers account for an estimated 40 percent of data center power use. More powerful servers consume more electricity, but today's servers are more efficient than previous generations.

Do data centers use a lot of energy?

High energy consumption continues to be an issue for data centers with the rise in AI use, but organizations are moving to energy-efficient systems to manage their power usage. Data centers are among the highest consumers of electric power. Studies have shown that data center energy consumption increases annually, with three identifiable trends.

How does data center energy consumption change over time?

Studies have shown that data center energy consumption increases annually, with three identifiable trends. The first trend is that mainstream legacy corporate data centers continue to be major consumers of power, despite many organizations migrating systems and hardware to cloud environments.

How much energy will data centers consume in 2026?

There were several eye-popping predictions in this year's analysis from the long-running International Energy Agency. Data centers consumed 460 terawatt-hours (TWh) in 2022 around the world, according to their calculations — but by 2026 could be consuming more than 1,000 TWh, an amount “roughly equivalent to the electricity consumption of Japan.”

How much power does a storage device use?

Storage devices consume a negligible amount of data center power. The number of storage devices has decreased as capacity has increased, and solid-state drives (SSDs) use far less power than legacy hard disk drives. Increased

use of SSDs can further reduce power consumption.

How much power does a data center need?

Some of the world's largest data centers can each contain many tens of thousands of IT devices and require more than 100 megawatts (MW) of power capacity—enough to power around 80,000 U.S. households (U.S. DOE 2020).

## How much energy does a storage project typically consume
