Overview

What is the difference between a solar-only system and a hybrid system?

Solar-only systems rely exclusively on photovoltaic panels and battery storage. Hybrid systems combine solar with wind turbines or generators for redundancy. Backup systems maintain minimal power during outages using smaller components. Each type offers different levels of energy independence based on your location climate and power requirements.

How do I design an off-grid solar or battery system?

The most important part of designing any off-grid solar or battery system is calculating the daily energy requirement in kWh. For grid-connected sites, detailed load data can often be obtained directly from your electricity retailer or by using meters to measure the loads directly.

What is a hybrid inverter?

Hybrid inverters and AC-coupled battery systems generally use transformer-less inverters with 'switching transistors'. These compact, all-in-one inverters have lower surge and peak power output ratings but are more cost-effective because they combine the solar inverter (MPPTs) and battery inverter-charger into one integrated unit.

What battery voltage does a hybrid inverter use?

All hybrid and off-grid inverters are designed to use a specific nominal DC battery voltage, the most common being 48V. Since most lithium battery systems are 48V, this is not a problem. However, many small-capacity inverters use 12V or 24V, so these are only compatible with battery banks of the same voltage.

How do I Configure my battery bank?

Configure your battery bank based on your daily power requirements and system voltage. Wire batteries in series to increase voltage while maintaining

amp-hour capacity. Connect in parallel to increase amp-hour capacity while keeping voltage constant. Calculate your battery bank size using this formula:
