Inverter AC input current exceeds limit

Overview

What is the maximum current per string in an inverter?

Therefore, if a string has the maximum input of 5250W, and an output of 350V, then we know that the maximum current per string into the inverter is: $5250W \div 350V = 15A$. 15A can be used for wire sizing the homerun back to the inverter. The inverter has two inputs that can hold up to 6AWG wire.

What happens if I increment the input current limit a little?

Here's the weird thing: If I increment the input current limit just a little, the actual power drawn from the shore increases dramatically. Here's my observational data: AC input voltage is roughly 108-112V in all cases. So why the huge jump in actual current, for a tiny bump in the set limit?

.

What is AC input current?

;) Hello, The AC input current is measuring the current on the AC input and controls this with PowerControl (charging the charge current to avoid AC input overload) or PowerAssist (adding energy from the battery to the AC power). It starts regulating at app 80% of the setpoint at the normal setting.

How many Watts Does a 2 in parallel inverter use?

With the current limit at 18 A (36A for 2 in parallel) the shore power stays ~ 3300 watts - under 3600 watts and the inverters don't go into assist mode normally.

How many watts does an AC run?

If I introduce an AC run about 1700 watts, and the load goes over 2400 watts for more than a minute or so the mode changes to assist. Also similarly if in bulk charging , can go from shore supply of 3000W at 115v to going into assist where shore doesn't go above 1600watts .

Inverter AC input current exceeds limit

EG4 6000xp "Discharge Current Limit" question

I have a question about the "Discharge Current Limit" setting. I have no BMS at the moment and the inverter is only running in LeadAcid mode with lithium batteries operated by ...

AC input current limit setting is very different from where it actually

With a parallel setup, you don't have to divide the current limit setting, the system does that for you, so a 30A limit = 2x 15A (for double inverters) and 30A max on the input.
