# Inverter needs to pre-charge the battery

51.2V 300AH

## Overview

---

You need to precharge any inverter 2000W or above. It's important to do this any time that you've disconnected the batteries for a prolonged period. Smaller inverters have smaller capacitors that charge even quicker than those in larger inverters. Do I need to pre-charge my inverter?

All of our large inverter and inverter/charger kits include the required resistor to allow you to safely pre-charge it. If you have a lithium battery bank, it's really important to pre-charge your inverter (2000W+) to protect your BMS. Nevertheless, pre-charging is still necessary if you have AGM batteries.

Why do I see 'precharge inverter'?

I usually see 'precharge inverter' when connecting a large one (say 3kW) to the batteries to avoid arcing from the sudden current in rush (due to the large capacitors taking a charge) when connecting the wires. I think it's more of a safety issue when connecting wires.

How do you precharge an inverter?

Precharge is done by using a large resistor as a jumper from the hot wire to the wire lug, hold for a few seconds, then you can connect the wire to the lug without even a tiny spark. Which batteries and inverter do you have?

While I understand having a main disconnect on the inverter, why use that every time vs just turning the inverter itself off?

.

Do inverters use a high power resistor?

I've watched Will Prowse and others on Youtube pre-charging the capacitors on their inverters before connecting them to the battery. Generally, they use a high power resistor to ease the current in without a big spark.

What happens when you connect a battery bank to an inverter?

When you connect a battery bank to the inverter, a surge of current known as an inrush current flows to fill the capacitors. Initially, the voltage in the capacitors is zero, and they offer no resistance. So, for a very short amount of time, the connected components act as if they were short-circuited.

How do you precharge a battery?

Turn on the breaker to the inverter, turn on the breaker from one battery, then turn on the battery on/off switch. It does the pre-charge. Then turn on the inverter, then all the other breakers then the batteries one at a time. If the battery doesn't have a on/off switch you need to use a resistor to pre-charge the inverter capacitor first.
