

## SolarMax Energy Systems

**Is the voltage between the  
battery and the BMS high or  
low**

## Overview

---

Do lithium ion batteries need a BMS system?

Lithium-ion batteries, especially custom lithium ion battery packs, need a BMS (Battery Management System) to ensure the battery is reliable and safe. The battery management system is the brain of the lithium battery and reports the status and health of the battery. Let's get a better understanding from this article. What is a BMS System?

.

What does BMS mean in a battery?

At its core, BMS stands for Battery Management System. It's an essential component for lithium-ion batteries, which are commonly used in electric vehicles (EVs), energy storage systems (ESS), and other devices that require rechargeable batteries.

How does a BMS charge a lithium ion battery?

As cells approach their maximum voltage (typically 4.2V for lithium-ion), the BMS gradually reduces charging current following a constant-current/constant-voltage (CC/CV) profile. The charging cutoff occurs when both voltage and current criteria are met - usually when current drops below C/20 (5A for a 100Ah battery) while at maximum voltage.

What is a battery management system (BMS)?

Modern lithium batteries are more than just rows of chemical cells—they're smart energy systems, and the Battery Management System (BMS) is their brain. Without a properly functioning BMS, even the most advanced battery pack can fail, shut down, or become a safety hazard.

What is a battery balancing system (BMS)?

The BMS works to balance the individual cells in the battery pack, ensuring

that all cells are operating at the same voltage level. This balancing helps avoid cell imbalance, which can reduce battery efficiency and lifespan. As a result, a BMS significantly enhances the overall performance of the battery.

Why is hardware BMS better than smart battery management system?

The technology of hardware BMS is more stable than smart battery management systems. The software engineer codes the hardware BMS which manages or monitors the battery pack status. The BMS is the brain of the lithium-ion battery. We not only are good at designing and developing the BMS but also inspecting the risks.
