# Lead-acid battery energy storage ratio

## Overview

---

When it comes to energy storage ratios, lead-acid batteries exhibit a lower energy density, generally ranging between 30 Wh/kg and 50 Wh/kg. Are lead-acid batteries a good choice for energy storage?

Lead-acid batteries have been used for energy storage in utility applications for many years but it has only been in recent years that the demand for battery energy storage has increased.

How many lead acid batteries should I buy?

In other words, you would need to purchase 4x as many lead acid batteries as lithium batteries to reach the same usable capacity. Beyond depth of discharge and roundtrip efficiency, be sure to consider cycle life, or the number of charge/discharge cycles you can get out of a battery over the course of its life.

Are lead batteries sustainable?

Improvements to lead battery technology have increased cycle life both in deep and shallow cycle applications. Li-ion and other battery types used for energy storage will be discussed to show that lead batteries are technically and economically effective. The sustainability of lead batteries is superior to other battery types.

How much lead does a battery use?

Batteries use 85% of the lead produced worldwide and recycled lead represents 60% of total lead production. Lead-acid batteries are easily broken so that lead-containing components may be separated from plastic containers and acid, all of which can be recovered.

What is a lead acid battery?

Lead-acid batteries may be flooded or sealed valve-regulated (VRLA) types and the grids may be in the form of flat pasted plates or tubular plates. The

various constructions have different technical performance and can be adapted to particular duty cycles. Batteries with tubular plates offer long deep cycle lives.

Are lithium batteries better than lead acid batteries?

After factoring in both depth of discharge and roundtrip efficiency in the above example, the lithium batteries have almost four times higher usable capacity than the lead acid batteries, despite having the exact same 10 kWh nameplate capacity.
