

## SolarMax Energy Systems

# Local energy storage power supply is worth recommending

## Overview

---

What is local energy storage?

Local energy storage can be applied to assist with voltage regulation (specifically voltage rise) in the presence of high levels of distributed generation. Energy storage may be used to absorb the active power injected by the local generation, reducing the amount exported into the supply network.

Is the size of energy storage sufficient for voltage regulation?

Whilst effective in theory, most studies indicate that the size of the energy storage compared to the size of the distributed generation is not sufficient to be able to store enough energy to provide an effective voltage regulation response—typically, the energy storage fills before peak generation (and peak voltage rise).

What is energy storage?

Energy storage may be used to absorb the active power injected by the local generation, reducing the amount exported into the supply network. This energy storage may take the form of batteries as well as alternate energy storage such as hot water.

What is local energy storage (CES)?

Local CES refers to shared residential as well as shared energy storage in a localized community. The members have shared goals such as energy independence, resiliency, autonomy as well as energy security and self-govern and own the CES. Shared local energy storage is emerging in the energy landscape.

Should energy storage be included in the electric grid?

Integrating storage in the electric grid, especially in areas with high energy demand, will allow clean energy to be available when and where it is most

needed. As New York continues to invest and build a cleaner grid, energy storage will allow us to use existing resources more efficiently and phase out the dirtiest power plants.

How will energy storage impact New York?

Storage will increase the resilience and efficiency of New York's grid, which will be 100% carbon-free electricity by 2040. Additionally, energy storage can stabilize supply during peak electric usage and help keep critical systems online during an outage. All of this while creating an industry that could employ at least 30,000 New Yorkers by 2030.
