Netherlands Communications 5G base stations are all SA base stations

CE UN38.3 MSDS

Overview

The major difference between 5G standalone (SA) and non-standalone (NSA) is in the core network. Specifically, 5G NSA involves laying the 5G RAN over an existing 4G LTE network, whereas 5G SA requires.

What is NSA and SA in 5G?

Mobile communication network consists of an access network (base station), a bearer network, and a core network. Then, NSA and SA are the matching networking modes of the base station and core network. They are also the most general networking modes of 5G worldwide. Let's get to learn more about them! Part I. What is NSA and SA in 5G.

What is the purpose of the 5G base station in Maastricht?

The purpose of the 5G base station in Maastricht is to gain experience in integrating 5G technology with the commercial network before expanding 5G pilot activities to Eindhoven in autumn 2019, [1].

Should you invest in 5G base stations?

Option 6 The Option 6 is to connect 5G base stations to the 4G core network. This option can hardly make use of the power of 5G base stations. Considering that 5G base stations are already a bigger part of investment compared to 5G core network, it's not really a reasonable choice to trade large investment with little return.

What is a 5G NR Network?

As defined in 3GPP TS 38.300, the 5G NR network consists of NG RAN (Next Generation Radio Access Network) and 5GC (5G Core Network). As shown, NG-RAN is composed of gNBs (i.e., 5G Base stations) and ng-eNBs (i.e., LTE base stations). The figure above depicts the overall architecture of a 5G NR system and its components.

What is 5G standalone (SA)?

5G standalone (SA) is a completely new mobile network architecture. It

enables all of the capabilities of 5G, given that it is not dependent on any existing 4G LTE infrastructure. 5G SA involves a new 5G packet core architecture, which means that 5G services can be deployed without pre-existing 4G LTE equipment in the network.

What is a 5G SA core network?

The 5G SA core network is cloud-native and is designed as a service-based architecture (SBA), which is built with new capabilities like the network resource function (NRF). More specifically, NRF acts as a directory for all available network services, such that they can be easily located and accessed by customers.
