

## SolarMax Energy Systems

# Onsite energy outdoor charging without solar energy

## Overview

---

Do off-site solar and wind projects work everywhere?

They also don't work everywhere as solar and wind resource varies from location to location, as well as incentives and rebates. Large energy consumers are increasingly looking to procure their renewable energy from off-site projects.

Are on-site and off-site energy systems a good investment?

Many benefits exist for both on- and off-site systems. On-site systems offer a better return on investment because financial savings are across the entire electricity supply chain – costs associated with energy generation, transmission and distribution, market volatility, and environmental costs.

What are on-site renewables?

First, let's define each. On-site renewables, aka direct, are "behind the meter" systems at a specific location, providing energy on-demand or via on-site storage (i.e., batteries). These are typically financed, owned, and managed by the company themselves.

Do on-site solar systems work everywhere?

However, many on-site systems simply can't scale large enough to cover full consumption needs, so they typically only cover a percentage of the facility's needs, relying on traditional electricity to cover the deficit. They also don't work everywhere as solar and wind resource varies from location to location, as well as incentives and rebates.

How does an on-site electricity system work?

On-site systems offset these costs as you're generating your own electricity. However, many on-site systems simply can't scale large enough to cover full consumption needs, so they typically only cover a percentage of the facility's needs, relying on traditional electricity to cover the deficit.

Should you install home storage without solar panels?

By installing home storage without solar panels, your battery can charge at night when utility rates are low and strategically discharge when rates are high, powering your home for a lower cost. Energy arbitrage is the process of buying grid electricity when it's cheap and selling it back when it's more expensive to get higher net metering credits.
