Overview

How to choose a portable power station for camping?

Setting one up inside a home or workshop means close quarters, and loud models could literally require hearing protection. A portable power station for camping should also be quiet, or else it may disturb the neighbors. Typically, electric and solar power stations make for the quietest generators available.

What is a portable power station?

A truly portable power station will be light and small, but it won't be able to do as much as the huge ones. It all depends on what you need. The smaller power stations are usually great at charging phones, tablets, powering small appliances, etc.

Which portable power station should I buy?

If you are searching for a compact portable power station for on-the-go activities, the Jackery Explorer 300 is our recommendation. This unit is ideal for charging phones and laptops or running small appliances like lights and fans. Its small form makes it an extremely versatile option.

What is the power output of a portable power station?

Power output of a portable power station refers to the maximum amount of energy the station delivers to the attached devices. Power output ratings are available in terms of wattage. How many watts a device will deliver explains how much power it can produce. The more watts a device can produce, the larger the electrical component it can run.

Which solar power station is best for off-grid camping?

The Jackery Solar Generator 1000 is a complete solar-powered portable power station package, which is why I think it's the best option for off-grid camping. I use Jackery's solar panels with my Explorer 1500, but they work just as well with this model (as a package deal).

How long does a portable power station last?

A portable power station's lifespan depends on the type of battery inside. Most new portable power stations, including all the models we recommend here, feature LiFePO4 battery technology, which lasts far longer than older lithium-ion technology. How much more?

LiFePo4 power stations will last for more than 3,000 charge cycles, or about 10 years.
