

## SolarMax Energy Systems

# Photovoltaic energy storage cabinets to reduce peak loads and fill valleys

## Overview

---

Why is energy storage important in a photovoltaic system?

When the electricity price is relatively high and the photovoltaic output does not meet the user's load requirements, the energy storage releases the stored electricity to reduce the user's electricity purchase costs.

What is user-side energy storage?

The configuration of user-side energy storage can effectively alleviate the timing mismatch between distributed photovoltaic output and load power demand, and use the industrial user electricity price mechanism to earn revenue from peak shaving and valley filling.

How to increase the economic benefits of photovoltaic?

When the benefits of photovoltaic is better than the costs, the economic benefits can be raised by increasing the installed capacity of photovoltaic. When the price difference of time-of-use electricity increases, economic benefits can be raised by increasing the capacity of energy storage configuration.

What determines the optimal configuration capacity of photovoltaic and energy storage?

The optimal configuration capacity of photovoltaic and energy storage depends on several factors such as time-of-use electricity price, consumer demand for electricity, cost of photovoltaic and energy storage, and the local annual solar radiation.

Can a company provide supplemental power to avoid peak loads?

For some industries, and their production's proper functioning, changing the load profile can be difficult. However, a company can provide its own supplemental power to avoid peak loads. Additional power could come from alternative sources such as an energy storage system, gensets, and/or power

plant.

What is the energy storage capacity of a photovoltaic system?

The photovoltaic installed capacity set in the figure is 2395kW. When the energy storage capacity is 1174kW h, the user's annual expenditure is the smallest and the economic benefit is the best. Fig. 4. The impact of energy storage capacity on annual expenditures.
