# Solar panel industry recommendation

## Overview

---

What will drive the growth of solar PV panels industry?

Growing demand for renewables-based clean electricity coupled with government policies, tax rebates, and incentives to install solar panels is expected to drive the growth of solar PV panels industry in the coming years. Asia Pacific held the largest market share of over 54.0% in 2023.

Why should you choose the best solar panel brands?

With the growing demand for renewable energy, solar panel brands have become an essential investment for homeowners, businesses, and industries. Choosing the best solar panel brands ensures high efficiency, durability, and long-term savings. With multiple brands available in the market, making the right choice can be challenging.

How many solar panels do I Need?

Start with your annual kWh usage (found on your electricity bills) and divide it by what each panel can produce in your area. A typical 400W panel in a location with good sun exposure produces about 600-700 kWh annually. So if your home uses 12,000 kWh per year, you'd need approximately 17-20 panels to cover your electricity needs completely.

Are solar panels a good investment?

The growth of solar PV panels in the residential segment is attributed to numerous benefits such as lower carbon footprints, lower electricity bills, and higher home values. With the help of solar systems, consumers are eligible for tax credits introduced by governments.

What are the best residential solar panels?

Qcells has the most innovative residential solar panels on the market and boasts an impressive number of features that put the company's panels above competitors. We like that the maximum efficiency available is 22.5% for

residential panels, placing this brand of solar panels at the top in terms of performance.

What makes a good solar panel?

The best solar panels offer linear degradation schedules rather than step-down guarantees. Maximum annual degradation of 0.5% or less separates quality panels from budget options. Premium panels using N-type cell technology can achieve degradation rates as low as 0.25% per year.
