**Solar panels can be connected
to on-site energy**

Overview

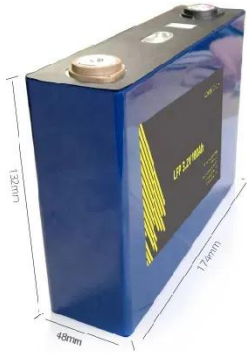

The electrical grid must be able to reliably provide power, so it's important for utilities and other power system operators to have real-time information about how much electricity solar systems are producing. Increasing amounts of solar and DER on the grid lead to both opportunities and challenges for grid reliability.

For most of the past 100 years, electrical grids involved large-scale, centralized energy generation located far from consumers. Modern electrical grids are much more complex.

Increased solar and DER on the electrical grid means integrating more power electronic devices, which convert energy from one form to another. This could include converting between high and low voltage, regulating the amount of power flow, or converting.

Since solar energy can only be generated when the sun is shining, the ability to store solar energy for later use is important: It helps to keep the

Solar Systems Integration Basics

Inverters convert DC electricity, which is what a solar panel generates, to AC electricity, which the electrical grid uses. Since solar energy can only be generated when the sun is shining, the
