# System resistance of flow battery

## Overview

What is a flow battery?

Flow batteries allow for independent scaleup of power and capacity specifications since the chemical species are stored outside the cell. The power each cell generates depends on the current density and voltage. Flow batteries have typically been operated at about 50 mA/cm<sup>2</sup>, approximately the same as batteries without convection.

What are the components of a flow battery?

Flow batteries comprise two components: Electrochemical cell Conversion between chemical and electrical energy External electrolyte storage tanks Energy storage Source: EPRI K. Webb ESE 471 5 Flow Battery Electrochemical Cell Electrochemical cell Two half-cells separated by a proton-exchange membrane(PEM).

How does electrolyte resistance affect a membraneless single flow battery?

For membraneless single flow battery designs, electrolyte resistance is the leading contributor to overall battery resistance , , which directly impacts the power output .

What is the difference between power and capacity of a flow battery?

The capacity is a function of the amount of electrolyte and concentration of the active ions, whereas the power is primarily a function of electrode area within the cell. Similar to lithium-ion cells, flow battery cells can be stacked in series to meet voltage requirements. However, the electrolyte tanks remain external to the system.

What is a flow battery stack?

Flow battery stacks typically consist of dozens of single cells connected electrically in series to achieve a high input/output voltage. Each single cell is connected to a tree-structured pipeline to enable parallel electrolyte feeding.

Do flow batteries need a fluid model?

Flow batteries require electrolyte to be pumped through the cell stack Pumps require power Pump power affects efficiency Need a fluid model for the battery in order to understand how mechanical losses affect efficiency K. Webb ESE 471 29 RFB Fluid Model Power required to pump electrolyte through cell stack Pumping power is proportional to
