Temperature of photovoltaic panels when generating electricity

Overview

What temperature should a solar panel be at?

For solar panels, the optimal outdoor temperature—the temperature at which a panel will produce the most amount of energy—is a modest 77°F. Here's how temperature affects solar production. A solar panel's current and voltage output is affected by changing weather conditions, and must be adjusted to ensure proper operation in your region.

How does temperature affect solar panels?

In a nutshell: Hotter solar panels produce less energy from the same amount of sunlight. Luckily, the effect of temperature on solar panel output can be calculated and this can help us determine how our solar system will perform on summer days. The resulting number is known as the temperature coefficient.

Are solar panels rated to operate in a wide temperature range?

Although extreme conditions will affect solar panel performance efficiency, solar panels are rated to operate in a very wide temperature range. Designed to function in real-world conditions, most solar panels have an operating temperature range wide enough to cover every single day of your system's multi-decade lifetime.

What role does operating temperature play in photovoltaic conversion?

The operating temperature plays a key role in the photovoltaic conversion process. Both the electrical efficiency and the power output of a photovoltaic (PV) module depend linearly on the operating temperature.

What is a solar panel temperature coefficient?

To get a bit technical, solar panels are rated with "temperature coefficients" that represent efficiency losses related to temperature changes above 77°F. For example, let's say your solar panel has a temperature coefficient of

-0.35%.

How does temperature affect PV panel performance?

The decrease in performance is often quantified as the temperature coefficient, typically expressed in percentage per degree Celsius (%/°C). For silicon PV cells, the average temperature coefficient for power output is around -0.4%/°C. This means for each degree above 25°C, the efficiency of the panel may decrease by 0.4%.

Temperature of photovoltaic panels when generating electricity

What is the temperature of solar panels when ...

The temperature of solar panels during the generation of electricity can vary significantly based on multiple factors, including ambient ...
