

SolarMax Energy Systems

What are the energy storage systems in the El Salvador power station

Overview

The project is comprised of a 380-megawatt (MW) natural gas-fired power plant, a permanently moored floating storage regasification unit (FSRU), a 1.8-km subsea pipeline that connects the power plant to the FSRU, and two 230-kV electric transmission lines, one of which connects to the Central American Electrical Interconnection System, providing added grid reliability to the region and opening further opportunities for renewable energy in El Salvador. How does EDP work in El Salvador?

By shifting a significant amount of power supply to natural gas, EDP reduces El Salvador's reliance on diesel and heavy fuel oil-fired power generation, offsetting 600,000 tons of carbon dioxide emissions per year, and provides grid support to facilitate more renewable energy penetration, further diversifying the country's energy mix.

Who financed El Salvador's infrastructure project?

The more than \$1 billion transformative infrastructure project, the largest-ever private investment in El Salvador, was financed by leading global financial institutions U.S. International Development Finance Corporation, International Finance Corporation, IDB Invest, Finnish Export Credit Ltd and KfW IPEX-Bank.

Who developed the EDP project in El Salvador?

Invenergy served as lead developer of the EDP project with the support of El Salvador-based partners Grupo Calleja, VC Energy de Centroamerica and Quantum Energy. To construct the project, Invenergy worked with a consortium of global project partners including BW LNG, BW Offshore, SAAM Towage, Boskalis, Wärtsilä, Elecnor, and Shell.

What are the energy storage systems in the El Salvador power station?

El Salvador Energy Storage: First Power Plant in Central America

This 2.15 MWh system, integrated with a 3.6 MWp solar power plant in San Miguel, El Salvador, represents a major advancement in renewable energy for the region.
