

## SolarMax Energy Systems

# What are the wind power sources for Iceland's communication base stations

## Overview

---

Is wind energy production viable in Iceland?

To be able to determine to what extent wind energy production in Iceland is viable, the annual averages of wind power density and available power need to be compared with the wind resources of other countries, as well as with the capacity of domestic hydro and geothermal power plants.

What is the energy supply in Iceland?

In terms of total energy supply, 85% of the total primary energy supply in Iceland is derived from domestically produced renewable energy sources. Geothermal energy provided about 65% of primary energy in 2016, the share of hydropower was 20%, and the share of fossil fuels (mainly oil products for the transport sector) was 15%.

How much electricity does Iceland use?

In 2015, the total electricity consumption in Iceland was 18,798 GWh. Renewable energy provided almost 100% of electricity production, with about 73% coming from hydropower and 27% from geothermal power. Most of the hydropower plants are owned by Landsvirkjun (the National Power Company) which is the main supplier of electricity in Iceland.

Does Iceland use geothermal energy?

In 2013 Iceland also became a producer of wind energy. The main use of geothermal energy is for space heating, with the heat being distributed to buildings through extensive district-heating systems. About 85% of all houses in Iceland are heated with geothermal energy. In 2015, the total electricity consumption in Iceland was 18,798 GWh.

Can wind power be used in Iceland?

The use of wind power for electricity generation in Iceland has hitherto been limited to small wind turbines for off-grid use, and until recently there were no

large wind turbines in operation in Iceland. Despite Iceland having a favourable climate for wind power , detailed research into the wind power potential in Iceland is quite recent.

Why is Iceland a good place for wind exploitation?

Due to its geographical location and meteorological conditions, Iceland is ideal for wind exploitation. Due to Iceland's geographical location it seems ideal for wind exploitation. Interest in wind power has increased significantly in the past decade. A few small turbines are operating with a total installed capacity of 2.4 MW.

## What are the wind power sources for Iceland s communication base
