What is a solar photovoltaic power plant?

A solar photovoltaic (PV) power plant is an innovative energy solution that converts sunlight into electricity using the photovoltaic effect. This process occurs when photons from sunlight strike a material, typically silicon, and displace electrons, generating a direct current (DC).

How does photovoltaic (PV) technology work?

Learn the basics of how photovoltaic (PV) technology works with these resources from the DOE Solar Energy Technologies Office. Solar photovoltaic modules are where the electricity gets generated, but are only one of the many parts in a complete photovoltaic (PV) system.

What are the components of a photovoltaic power plant?

A photovoltaic power plant consists of several components, such as: Solar modules: The basic units of a PV system, made up of solar cells that turn light into electricity. Solar cells, typically made from silicon, absorb photons and release electrons, creating an electric current.

What type of electricity is supplied by a PV system?

Nearly all electricity is supplied as alternating current (AC) in electricity transmission and distribution systems. Devices called inverters are used on PV panels or in PV arrays to convert the DC electricity to AC electricity. PV cells and panels produce the most electricity when they are directly facing the sun.

What is a photovoltaic (PV) cell?

A photovoltaic (PV) cell, commonly called a solar cell, is a nonmechanical device that converts sunlight directly into electricity. Some PV cells can convert artificial light into electricity. Sunlight is composed of photons, or particles of solar energy.

How are PV panels different from other solar power plants?

PV panels are distinct from other solar power plants as they use the photo effect directly without needing other processes or devices. For example, they do not use a liquid heat-carrying agent, like water, as in solar thermal plants. PV panels do not concentrate energy; they convert photons into electricity transmitted somewhere else.
