

## SolarMax Energy Systems

# What size inverter should I use for a 50w solar panel

## Overview

---

### What size solar inverter do I Need?

A 4.5 kW array (or ten 450-watt solar panels) would just about cover your consumption. The type of solar panels you choose can also impact the size of the inverter you need. Different types of solar panels have different wattage ratings and efficiency levels. The three main types of solar panels are monocrystalline, polycrystalline, and thin film.

### Why should you choose a solar inverter size?

Inverters play a vital role in converting the direct current (DC) generated by your solar panels into usable alternating current (AC) for your home. Selecting the proper inverter size ensures that your solar system operates at its full potential, ultimately impacting energy savings and system longevity.

### How to choose a solar inverter?

Choose an inverter that has a surge watt rating equal to or greater than this value. As for voltage drop, check the wire length between your solar panels and the batteries. If the wire length is long, you may need to choose a lower voltage system (12V, 24V, or 48V) to minimize voltage drop.

### Do I need an inverter size chart?

The need for an inverter size chart first became apparent when researching our DIY solar generator build. Solar generators range in size from small generators for short camping trips to large off-grid power systems for a boat or house. Consequently, inverter sizes vary greatly.

### Do you need a solar inverter?

The inverter is one of the most important components of a home or portable solar power system. Solar panels produce DC electricity, but you need an inverter to convert DC power into 120/220 volt AC electricity. Only after conversion can home appliances and other devices use it.

Can a 5000W inverter oversize a solar system?

If you have connected a system producing 6kW of DC power to your 5000W inverter, you effectively oversize it by 20% (1.2). Exceeding this setup should truly bring no problems since solar systems hardly run at the maximum 6kW (it only comes up momentarily), as long as your system is appropriately designed.
