

## SolarMax Energy Systems

# What type of reactor is used in EU power plants

### Power Conversion System

- Single-stage three-level modularization
- Multi-branch input to reduce battery series and parallels connection

## Overview

---

This is a list of all the commercial nuclear reactors in the European Union and in Europe, with operational status. The list only includes civilian nuclear power reactors used to generate electricity for a power grid. All commercial nuclear reactors use nuclear fission. How many nuclear power reactors are in the EU?

The 100 nuclear power reactors (98 GWe) operating in 12 of the 27 EU member states account for about one-quarter of the electricity generated in the whole of the EU. Over half of the EU's nuclear electricity is produced in only one country – France.

Which EU countries are pursuing new nuclear power projects?

A number of EU countries are also pursuing new nuclear power projects. France is building a new nuclear reactor (Flamanville), and has plans for six (or possibly eight) additional new nuclear reactors. Bulgaria and Romania have advanced plans for two new nuclear reactors each. Bulgaria, Czechia and Finland are planning to construct one each.

How many EU countries use nuclear energy?

Currently 13 EU Member States out of 27 use nuclear energy for power generation. Nuclear energy currently generates a bit more than a quarter of all electricity in the EU. Nuclear safety is of the utmost importance to the EU and its people. The consequences of a major nuclear accident are also potentially ruinous to national economies.

Does the EU rely on nuclear power?

Analysis on behalf of Agora Energiewende The EU depends on nuclear power for more than one-quarter of its electricity, and a higher proportion of base-load power. Nuclear provides about 40% of the low-carbon electricity. Very different energy policies pertain across the continent and even within the EU.

Where do Russian nuclear reactors get their fuel?

Several Russian-designed nuclear power reactors get their fuel mainly from TVEL in Russia, and the older VVER-440 units depend wholly on TVEL for fuel fabrication. A lot of EU uranium enrichment and conversion is done in Russia, though other capacity is available in the EU and USA.

What is a European Pressurised Reactor (EPR)?

What is a European pressurised reactor (EPR) ?

A European Pressurised Reactor (EPR) is a type of nuclear reactor that belongs to the third generation of pressurised water reactors (PWRs). EPR reactors build on the strengths of earlier models while incorporating advanced safety features and greater efficiency.
