

## SolarMax Energy Systems

# Wind and solar power 2 kilowatts

## Overview

---

How much does wind energy cost compared to solar power?

Wind power LCOE decreased from \$135 per megawatt-hour to \$43 [\$112/MWh to \$36/MWh] between 2009 and 2018. Solar LCOE matched this reduction, dropping from \$359 to \$43 per megawatt-hour [\$298 to \$36/MWh]. What Makes Wind Energy More Efficient Than Solar Power?

Wind turbines transform 60% to 90% of wind energy into electricity.

Do wind turbines produce more energy than solar panels?

One single wind turbine can generate the same amount of electricity in kilowatt-hours as thousands of solar panels. But just because wind turbines produce more energy doesn't make wind energy the undefeated winner. Solar energy, through the CSP systems, can also be used even without the sun.

What is the difference between wind and solar energy?

Wind power is commonly used for large-scale electricity generation and is often integrated into the grid. Solar energy is versatile in its own right. Solar panels can be installed on residential rooftops, commercial buildings, and even in remote off-grid locations.

Is wind energy cleaner than solar?

Wind energy is cleaner than solar energy. That said, both Solar and wind energy systems create dramatically fewer carbon emissions compared to traditional fossil fuel power plants. Wind turbines generate approximately 4-34 grams of CO<sub>2</sub> per kilowatt-hour (kWh), while solar panels produce about 6-50 grams of CO<sub>2</sub> per kWh.

How much energy does a wind turbine produce?

While wind turbines convert 35-45% of available wind energy into electricity compared to solar's 20-24% conversion rate, the actual energy output

depends on resource availability. Capacity factor measures how much energy a system produces compared to its theoretical maximum.

How much energy does a 10 kW solar system produce?

A typical 10 kW residential solar system produces approximately 12,000-15,000 kWh annually, depending on location and sun exposure. A comparable 10 kW wind turbine might produce 15,000-25,000 kWh annually in optimal wind conditions, but performance varies dramatically based on wind resource quality.
