

## SolarMax Energy Systems

# Wind solar thermal and storage multi-energy complementarity

## Overview

---

What is a multi-energy complementary power generation system?

The multi-energy complementary power generation system, incorporating wind, solar, thermal, and storage energy sources, plays a crucial role in facilitating the coexistence and mutual reinforcement of conventional thermal power and renewable energy.

Can multi-energy complementary system promote grid-connection of wind power and photovoltaic power?

Finally, the IEEE 14-node 5-machine system is connected with WPP, PV, HS and ESD to form a simulation system. The results show that: (1) the multi-energy complementary system can make full use of the complementary characteristics of different power sources to promote the grid-connection of wind power and photovoltaic power generation.

What is the optimal configuration of multi-energy complementary power generation?

The mode considers carbon quota, CO<sub>2</sub> emission, and the output of wind and solar storage systems. The optimal configuration of multi-energy complementary power generation is explored using the particle swarm algorithm. The objective functions are to minimize CO<sub>2</sub> emission and maximize the economic benefit of coordinated power generation.

Can a multi-energy complementary system use different types of power resources?

Finally, case study is conducted on a revised IEEE 30 node system. Simulation results demonstrate that the proposed method can fully utilize the characteristics of different kinds of power resources to consume renewable energy and enhance the safety and economy of the multi-energy complementary system.

What is a complementary power system model?

The model minimizes the cost of the complementary system while ensuring power balance and operation constraints of each power unit.

Can a particle swarm optimize a multi-energy complementary power generation system?

Additionally, it proposes a two-layer optimization model for configuring a multi-energy complementary power generation system using a particle swarm algorithm. The objective is to minimize carbon emissions and maximize the economic benefit of power generation companies.

## Wind solar thermal and storage multi-energy complementarity

---

### Capacity planning for wind, solar, thermal and energy storage in ...

To address this challenge, this article proposes a coupled electricity-carbon market and wind-solar-storage complementary hybrid power generation system model, aiming ...
